Network Tradecraft Advancement Team
(NTAT)

Overview

* What is the NTAT?

* 2011 – 2012 work and accomplishments

TOP SECRET//SI

Tradecraft?

Tradecraft

- “The development of methods, techniques, algorithms and processes in order to generate [Intelligence](#), and developing the ability to apply this knowledge either manually or through automation. Tradecraft is developed from experience, research, intuition and by the reapplication and redefinition of existing techniques. **Industrial-Scale Tradecraft** involves data on a large scale.”

Network Tradecraft

- Usable knowledge about how to acquire intelligence FROM the network

TOP SECRET//SI

The NTAT

- * Create repeatable, sustainable & shareable tradecraft to enable network analysis
- * Facilitate knowledge collaboration and interchange across the 5-Eyes SIGDEV community

TOP SECRET//SI

The Process

Stage 1 = Fact Finding

Stage 2 = Define Focus (based on Fact Finding)

Stage 3 = Develop Tradecraft

Stage 4 = Document Tradecraft

Stage 5 = Test Documented Tradecraft and Refine

TOP SECRET//SI

Network Convergence Tradecraft

- * Technological convergence – where voice and data services interact with each other on a single device
- * Tradecraft to enable the targeting of handsets in telephony space and CNE exploitation in IP space
- * Improved algorithms for mobile gateway identification and implementation of these algorithms

DSD Workshop November 2011

- * 2 weeks
 - * CSE, DSD, GCHQ
 - * Virtually, via chat room, NSA & GCSB
- * Focus on data, techniques & analytic outcomes

SECRET

Identify Servers communicating with a Mobile network

5 EYES CSEC DSD GCHQ GCSB NSA Factbox

Metadata

What does the tradecraft achieve?

- This tradecraft will provide a list of servers that have been seen communicating with a mobile network.

In what situations would this tradecraft be most useful?

- To identify mobile application servers for a specific network
- To identify any server that may be useful for collection purposes

Describe any problems, caveats or things to watch out for

- The list of servers returned depends on the the IP range and collection sources utilized. Success of this tradecraft may require additional research to identify other IP ranges or requesting other agencies to check their collection to identify different servers.

Links that can help you to implement this tradecraft

Created by: [redacted]

Agency: NSA

Email Address: [redacted]

Difficulty: ★★

Acceptance state: Limited

Input(s): Ontology/Network block, Ontology/Ip address

Output(s): Ontology/Ip address, Ontology/ASN, Ontology/Network block, Ontology/Hostname, Ontology/User Agent String, Ontology/Geographic selector

Invokes Tradecraft:

- Find public IP space used by Mobile Devices and Related Servers on the Internet
- Finding Mobile Internet Gateways

Input(s):

Ontology/Network block, Ontology/Ip address

Output(s):

Ontology/Ip address, Ontology/ASN, Ontology/Network block, Ontology/Hostname, Ontology/User Agent String, Ontology/Geographic selector

Invokes Tradecraft:

- Find public IP space used by Mobile Devices and Related Servers on the Internet
- Finding Mobile Internet Gateways

Alternatives:

- Identify Servers communicating with a Mobile network

5 EYES Tradecraft Steps (document underlying analytic, do not include tools) [edit]

The IP ranges utilized for the initial implementation of this tradecraft were the Inter PLMN Backbone IP ranges obtained from IR21 documents. For other methods of identifying mobile IP blocks, see the invoked tradecraft listed above.

Step 1) Take IP ranges or individual addresses identified as being related to mobile network communications.

Step 2) Obtain geolocation information and network ownership information for each IP address. This should include: Network Owner name, Carrier name, ASN, Continent, Country, Region, City, Lat, Long, and any other related details that your system can obtain.

Step 3) Obtain Internet communication events related to the IP addresses. These events should minimally include: source information, To IP, From IP, TCP Direction, and HTTP User-Agent.

Step 4) Sort the results and dedup them. This step depends on your collection sources.

Step 5) Filter out server communications that have user-agents that aren't useful. Further analysis is needed to identify the non-useful user-agents (cheat sheet needed). Ex: friendly-scanner

Step 6) Check the TCP Direction field:

- If Server to Client, grab the From IP information
- If Client to Server, grab the To IP information
- If Server to Server, grab both the To and From IP information
- If Unknown, capture in an error log

Step 7) Sort and dedup again based on Server IP information. TCP Direction info is no longer needed.

Step 8) Obtain geolocation information and network ownership information for each Server IP. This is done for the servers that were not in the original IP Blocks.

Step 9) Remove any servers that are not useful. This may include 5-Eyes servers.

Step 10) Output:

- List of Servers
- List of related User Agents
- List of related hostnames

TOP SECRET//SI

Identifying servers communicating with an MNO

TOP SECRET//SI

Profiling mobile application servers

This tradecraft will accept a CSV file of known apps server hostnames. It will then perform reverse DNS queries to obtain the IP addresses of the apps servers. With the IP addresses, geolocation and network provider queries will be performed on all app server IP addresses. The IP addresses are then used to search for TDI events associated with those IP addresses. The result is a list of the apps servers with IP addresses, geolocation and provider details, as well as TDI events seen connecting to those apps servers. The TDI events are also queried to determine their geolocation and provider details.

- * So what? We found some servers....
 - Ø Potential MiTM
 - Ø Effects
 - Ø Harvesting data at rest
 - Ø Harvesting data in transit

TOP SECRET//SI

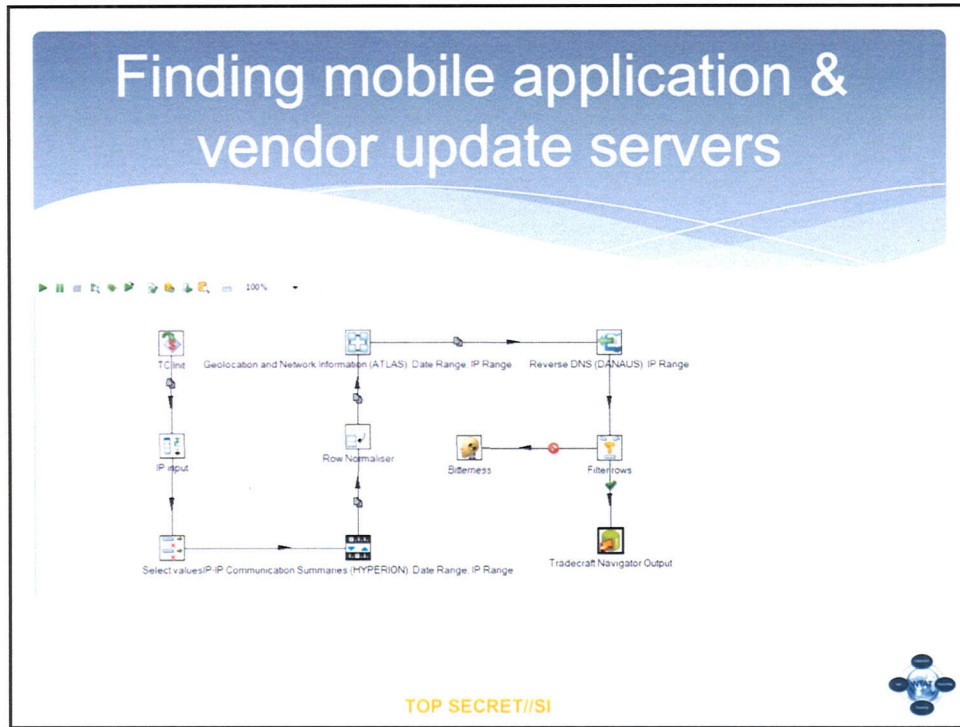

MiTM – exploit the application server and use it as a MiTM platform for handset exploitation

Effects – exploitation of the application servers could make it possible to provide selective misinformation to the targets handsets

Harvesting data at rest – exploitation of the applications servers could provide access to a wealth of information at rest. The amount and usefulness of this information depends on the application in question

Harvesting data in transit – mobile applications servers often send and receive data that SIGINT agencies find useful (e.g. the Samsung protocol sending client and handset details to a server in Germany)

The results above are from a tradecraft to find servers of applications and vendor updaters servers from given countries, The rationale behind this is to identify servers that target within those countries might visit which could be exploited by CNE to push a phone implant capability.

The tradecraft relies upon 5 tuple data seen from the mobile gateways from target countries and to servers which have matching 'key words' in the hostname. The results above could then be scoped for CNE to see if they would be valid boxes to use an access platform.

SEVES Tradecraft Steps (document underlying analysis, do not include tasks)

The IP ranges utilized for the initial implementation of this tradecraft were the listed IP ASN Ranges (derived from MIT documents). For other methods of identifying mobile IP blocks, see the associated tradecraft listed above.

Step 1: Take IP ranges or individual addresses identified as being related to mobile network communications.

Step 2: Obtain geolocation information and network ownership information for each IP address. This should include: Network Name, Carrier Name, ASN, Continent, Country, Region, City, IAS, Org, and any other related details that your system can obtain.

Step 3: Obtain related geolocation details related to the IP addresses. These details should minimally include: source information, To, IP, From, IP, TCP/UDP/Other, and HTTP User Agent.

Step 4: Sort the results and display them. This may depend on your collection sources.

Step 5: Filter out great communications that are seen as being that aren't useful. Further analysis is needed to identify the non-useful user agents (that should be hidden). Ex: Mozilla/5.0

Step 6: Check the TCP/UDP/Other field.

- Filter to Client: grab the From IP information.
- Filter to Server: grab both the To and From IP information.
- Customize: Adjust as necessary.

Step 7: Sort and display again based on Server IP information. TCP/UDP/Other is no longer needed.

Step 8: Obtain geolocation information and network ownership information for each Server IP. This is done for the servers that were not in the original IP blocks.

Step 9: Eliminate any servers that are not useful. This may include 0 day servers.

Step 10: Input:

- List of Servers.
- Geographical Area Agency.
- List of Related Hostnames.

Identifying servers communicating with an MNO

Profiling mobile application servers

TOP SECRET//SI

Profiling mobile application servers

- * Results based on mobile application servers seen in CSE collection
- * We have a list of the most popular smartphones for Warid Congo customers and their IMSIs

TOP SECRET//SI

Success Stories

- * UCWeb mobile browser identification
 - * Discovered by GCHQ analyst during DSD workshop
- * Chinese mobile web browser – leaks IMSI, MSISDN, IMEI and device characteristics

TOP SECRET//SI

UCWeb

- * Led to discovery of active comms channel from [REDACTED]

(S//SI//REL TO USA, FVEY) The CONVERGENCE team helped discover an active communication channel originating from [REDACTED] that is associated with the [REDACTED] as they are known within the [REDACTED] hierarchy area of responsibility is for covert activities in Europe, North America, and South America. The customer [REDACTED] leveraged a **Convergence Discovery capability that enabled the discovery of a covert channel associated with smart phone browser activity in passive collection.** The covert channel originates from users who use UCBrowser (mobile phone compact web browser). **The covert channel leaks the IMSI, MSISDN, Device Characteristics, and IMEI back to server(s) in [REDACTED]** initial investigation has determined that perhaps malware can be associated when the covert channel is established [REDACTED] covert exfil activity identifies SIGINT opportunity where potentially none may have existed before. Target offices that have access to X-KEYSCORE can search within this type of traffic based on their IMSI or IMEI to determine target presence.
